UCC – Project Task for Evaluation

Summary

Create a system with a separate backend and frontend, which communicate through the HTTP layer. The backend exposes a RESTful API, which is accessed by the frontend to perform various tasks.

Goals

- Deadline: **2026-03-15 23:59**
- Submit a video of the application in action (5-10 minutes), explaining key features.
- Create a presentation, in which you:
    1. Demonstrate your approach,
    2. Explain your solution,
    3. Illustrate the design (wireframes, sitemap, user journeys, data flow, etc),
    4. Describe the used tools & name the used sources.
- Create a simple API documentation that describes all the endpoints and their payloads (OpenAPI / Postman collection export)

Architecture

- For frontend, feature-based structure is preferred.
- For backend, service layer structure is preferred.

Functionality

1. The purpose of the system is to manage events for users.
    - Events are described by their:
        - Title - *mandatory*
        - Occurrence (date & time) - *mandatory*
        - Description - *optional*
    - Users can:
        - Create events,
        - List their events,
        - Update existing events' description,
        - Delete events
    - The system can manage multiple users and their associated events.
2. The core functionalities of the system must be protected from unauthorized access.
    - Login page without possibility for registration
    - Users need to have the option to ask for a password reset
    - **Bonus**: MFA is present.
3. Authentication to the backend API must adhere to a modern security standard (Oauth 2.0, JWTs or Basic when using TLS)
4. Data must be stored in a secure environment with appropriate access controls and encryption.
    - **Bonus**: Protection from various cyberattacks, OWASP Top 10 risks are addressed.
5. The system has a help desk which understands customers' free word questions, answers them and provides transfer to a human if requested.
    - Users with a specific privilege level (helpdesk agent) can access a separate interface, on which they can see previous chats, and answer new incoming ones.
    - **Bonus**: the system is also available on a voice basis (phone or web voice

Conclusion

The task gives the developer a large scope of freedom to use any software and system he or she chooses, apart from the non-regulated requirements, however **Laravel** and **Vue JS** stacsk is preferred. After evaluation of the video, selected candidates will be invited to the next stage.
